

General

The GSM Mobile Communicator provides a reliable and cost effective solution for notification of fault and alarm conditions on Identileak and Identi-Cryer control panels.

The communicator comes with 2 years subscription as standard.

Mobile Application

The GSM Mobile Communicator provides a reliable and cost effective solution for notification of fault and alarm conditions on Identileak and Identi-Cryer control panels.

The communicator comes with 2 years subscription as standard.

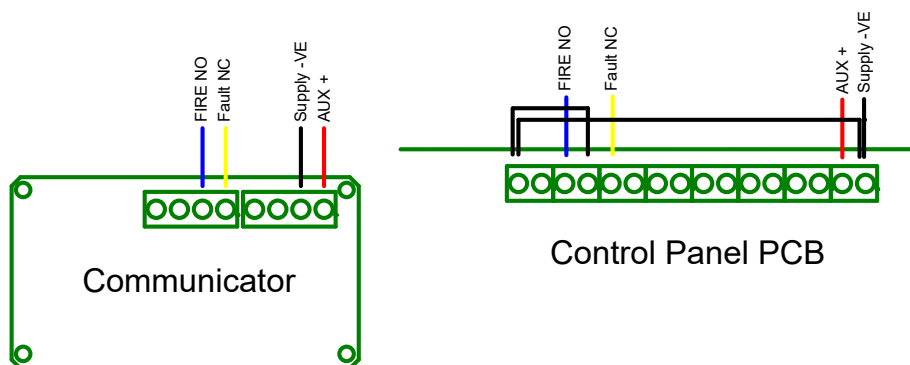

Wiring to the Panel

Wiring to the Control Panel for Both Identileak and Identi-Cryer are identical and shown below.

Each Communicator comes with the wiring connected to the PCB and only requires connection to the panel. Connect Terminals onto Communicator PCB (Using the wiring diagram to ensure relevant terminals are in the correct position)

Connect the aerial to the communicator PCB and is stuck to the panel using a self-adhesive backing.

Aerial Extension cables can also be purchased should the signal not be sufficient in the area the panel is installed. Extension cables can be provided in lengths of 3M and can be connected together up to 15M.

Setting Up the App

Once the 'Rcontrol' app has been installed, open the app and click the 3 lines in the upper left of the screen.

Add a device using the information provided on the Rating Label on the Communicator Carrier PCB - this can either be done via manually adding the information or scanning the QR code. Templates have been created for either a Lockdown Scenario or Water Leak Detection.

Should you require a different application contact VimpeX to create the required notifications.

Note: This product must not be used on Fire applications.

With VimpeX generated templates users will receive notifications for both Alarm and Fault - Alarms will sound audibly even if the device is on silent.
